NATOURS

(A Tour Planning Website)

A Training Report

Submitted by

YASH KUMAR PAL

Roll NO: 1914432

in partial fulfillment for the award of the degree of

BACHELORS OF TECHNOLOGY

In

COMPUTER SCIENCE AND ENGINEERING

At

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

CHANDIGARH ENGINEERING COLLEGE

LANDRAN, MOHALI

April 2022

This document is available on studocu

CANDIDATE'S DECLARATION

I hereby certify that the work which is being presented in the report entitled "**NATOURS"** in partial fulfillment for the award of the Degree of Bachelor of Technology in Computer Science and Engineering affiliated to **Punjab Technical University, Jalandhar** and submitted to the Department of Computer Science and Engineering of CGC College of Engineering, Landran, is an authentic record of my own work carried out during a period from **April 2022 to May 2022**. The matter represented in this report has not been submitted by me for award of any other degree of this or any other institute/university.

Date: 26/04/2022

Name: Yash Kumar Pal
Roll no.: 1914432

This is to certify that the above statement made by the candidate is correct to the best of our knowledge.

Date: 26/04/2022

Project Supervisor: Mr. Dishant Khosla

ABSTRACT

This is a full-stack Tour Planning website. For the front-end portion we used HTML, CSS, JavaScript, and for the back-end portion we used MongoDB, Express Js and Node Js. There are significant number of companies that provides real-time travel information, prices and availability for flights, trains, buses, and hotels, and allows ticket booking through its associate website and apps but no neither of them has the feature or 'Planning a Tour'. We discovered this sticky situation and conceived the idea of making this project which allows users to plan a tour. Here we provide a list of tours from which a person can select according to their aspiration. There is assortment of tours for a wanderer like Forest Hiker, Park Camper, Sea Explorer, Snow Adventurer and Sports Lover. The user information during the Signup / Login or password is stored at back-end. Additional features for users are that they can rate on tours, can upload images in review box plus they do credit card payments as well.

ACKNOWLEDGEMENT

I have taken keen efforts in this project. However, it would not have been possible without the kind support and help of my HOD Dr. Anuj Gupta and all the training faculties. I would like to extend my sincere thanks to them.

I am highly indebted to my respected teachers of CGC-College of Engineering, Landran, Mohali for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project.

I would like to express my gratitude towards my parents for their kind co-operation and encouragement which helped me in completion of this project.

My thanks and appreciation also goes to my friends in developing the project.

Yash Kumar Pal

INTRODUCTION

Project NATOURS as the name suggests is the combination of nature and tours (NATURE + TOURS). It is a website where anyone can book a full tour of the place that he/she wants to visit. Here, we also provide feedbacks where people can post their feedback regarding the tour.

This website was made using React JS, Express JS, Mongo DB and NodeJS. A person can login and can keep a tour in their wish list if they want and can plan a tour anytime in the future to that location. You can also add credit or debit card for purchases and get huge discounts. The website has minimalistic UI which makes the website more user friendly and easy to navigate.

The website aims to get the best possible deals for planning a tour without having to waste time in unnecessary searching and hassle. It makes easy for a person to plan a tour.

METHODOLOGY / FLOWCHART

- We are going to use HTML and CSS for the designing part.
- We are going to use react JS libraries to design customized web pages which will provide interactive user interface.
- To store the memories of Students we are going to use a flexible database Mongo DB.
- To get the data from database and display it to user Node Js is used.

FLOWCHART

FEASIBILITY STUDY/ VERIFICATION & VALIDATION

For the verification and validation of this project, a user was first created who first signed his id. Then it was checked whether its data was stored in the database or not. After signup, the login feature was checked. First by entering the wrong password in it, then by entering the correct password. After signup login, checked the features of the account page like image uploads, and contact verification. In this website, the user can buy any tour and give rating to that tour package. And this website shows this rating by calculating average rating, so this feature was also checked by making 10-15 accounts. After taking complete information about the tour package, the user can also buy it with his credit card. As soon as the user buys any tour and buys it with a credit card, his data gets stored on Stripe. With the help of Stripe, we have enabled the payment gateway in this project. As soon as a user purchases, his data will be stored on Stripe, as well as this tour package will also be uploaded on the user's My Package page. If both these things are done well then this feature of ours is working properly and these things are done well. After this, the normal features were checked with the help of the user we had created. The backbone of this website is node.js which was the most important thing to check. Node.js takes the data from the database and dumps the data into the HTML structure dynamically. To check this we created a new tour package.In which we gave a little information about the tour to the node and nodejs gave us a complete tour package. This is how we verified and validated our entire project.

SOFTWARE/ HARDWARE REQUIREMENTS

1. SOFTWARE REQUIREMENTS:

Languages Used: HTML5, CSS3, JavaScript, Node Js, Express Js, MongoDB

Client-side Environment: Web Browsers (Chrome, Internet Explorer 6.0 or above etc.)

Server Environments: MySQL 15.1, Apache Server 2.4.52

2. HARDWARE REQUIREMENTS:

Processor: 1.9 GHz x86- or x64- bit dual core processor

Memory (RAM): 2- GB RAM

Display: VGA display of Resolution 1920x1080

Downloaded by sintayehu mulugeta (sentaman20@gmail.com)

TECHNOLOGIES USED

HTML: **HTML** stands for Hypertext Markup Language. It is used to design web pages using a markup language. HTML is the combination of Hypertext and Markup language. Hypertext defines the link between the web pages. A markup language is used to define the text document within tag which defines the structure of web pages.

CSS: CSS stands for Cascading Style Sheets. It is the language for describing the presentation of Web pages, including colours, layout, and fonts, thus making our web pages presentable to the users. CSS is designed to make style sheets for the web. It is independent of HTML and can be used with any XML-based markup guage.

JavaScript: JavaScript (js) is a light-weight object-oriented programming language which is used by several websites for scripting the webpages. It is an interpreted, full-fledged programming language that enables dynamic interactivity on websites when applied to an HTML document. It was introduced in the year 1995 for adding programs to the webpages in the Netscape Navigator browser. Since then, it has been adopted by all other graphical web browsers. With JavaScript, users can build modern web applications to interact directly without reloading the page every time. The traditional website uses js to provide several forms of interactivity and simplicity.

Express Js: Express.js, or simply Express, is a back end web application framework for Node.js, released as free and open-source software under the MIT License. It is designed for building web applications and APIs. It has been called the de facto standard server framework for Node.js.

MongoDB: MongoDB is an open-source document database and leading NoSQL database. MongoDB is written in C++. This tutorial will give you great understanding on MongoDB concepts needed to create and deploy a highly scalable and performance-oriented database.

Node.js: Node.js is an open-source and cross-platform JavaScript runtime environment. It is a popular tool for almost any kind of project! Node.js runs the V8 JavaScript engine, the core of Google Chrome, outside of the browser. This allows Node.js to be very performant. A Node.js app runs in a single process, without creating a new thread for every request. Node.js provides a set of asynchronous I/O primitives in its standard library that prevent JavaScript code from blocking and generally, libraries in Node.js are written using non-blocking paradigms, making blocking behavior the exception rather than the norm
